

Gregory Pest Solutions

Larry Motes

October 20- 22, 2010

Gregory Pest Solutions

- Phil and Sara Gregory
- Opened in 1972, Greenville SC
- Operating across the Southeast (8 Branches)
- Heading into Virginia, Maryland
- Known for “Lime Green Trucks”

Pest Control

- Roaches
- Ants
- Termites
- Fleas
- Stored Product Pests
- Fire Ants
- Flies
- Bedbugs
- Residential
- Commercial
- Manufacturing
- Food Service
- Hotel/Hospitality
- Hospitals
- Nursing Facilities
- Warehouses

Bedbug Treatment

THERMAL REMEDIATION TREATMENT PROCESS

The Most Advanced Solution to Bed Bug Infestation

Bed bug infestations are becoming increasingly common. Unrelated to sanitation issues, infestations occur when bed bugs or their eggs are transported from one location to another — unknowingly carried in luggage, clothing, equipment, boxes, and the like. Quality hotels, private homes, apartments, office complexes — all are vulnerable to this problem.

Ridding an establishment of bed bugs is notoriously difficult. Bed bugs are small, nocturnal, and physically adapted for hiding in tiny crevices. They are hard to detect, and hard to kill. Tales abound in which fixtures, beds, carpets and clothing had to be tossed . . . of dwellings saturated with pesticides and scrubbed from ceiling to floor . . .

Now there's a better way

Gregory Pest Solutions is proud to introduce a revolutionary, state-of-the-art process that eliminates bed bugs with minimal preparation and inconvenience — and maximum effectiveness and environmental safety.

An Enlightened Solution to a Hidden Problem

Gregory's Thermal Remediation Treatment Process uses specialized electric heaters to heat the inside of the treatment area to a temperature above 120° F in order to kill bed bugs and their eggs that hide inside of furniture, fixtures, and other belongings.

For every kind of dwelling, building or facility — including houses, apartments, offices, hotels, dormitories — our Thermal Remediation process offers numerous advantages over conventional pesticide treatments:

- Pesticide usage inside the living environment is greatly reduced or eliminated
- Quicker, more complete and effective elimination of the infestation
- Very little preparation required prior to service
- Greatly reduces the chance of re-introduction of bed bugs
- No need to throw away mattresses, box springs or other furniture
- GUARANTEED elimination of the bed bugs

Gregory Pest Solutions' Thermal Remediation Process allows just about everything in the treatment area to be left in place — furniture, TVs, computers, bedding, clothing. In fact, it is very important that these items do remain in the treatment area, because bed bugs and their eggs can be in or on practically anything — and we don't want to let any survive.

Gregory's Thermal Remediation Treatment Process is guaranteed to eliminate bed bugs from:

- Single-Family Homes
- Offices
- Apartments and Condominiums
- Dormitories
- Hotels, Motels and Resort Properties

The Process: Safe, Effective, Non-Toxic

This treatment is completed using Gregory's Thermal Remediation equipment. This equipment is a self-contained system that utilizes space heaters and monitoring devices which are powered by the system and monitored throughout the process to achieve a safe and effective level of heat within the treated areas. The heat kills all stages of bed bugs — eggs, young, and adults.

A heat treatment involves the following steps:

1. The entire treatment area is heated to 120° F or higher. Once the heat in the treated area reaches the optimum temperature, it is maintained for 4 hours in order to ensure complete eradication of the infestation. The hot air is circulated using fans, and temperatures are monitored throughout the treatment area(s) during the process.
2. An application of residual insecticides may be made into the cracks and crevices where any surviving bed bugs might be crawling. In most cases, this process eliminates all bed bugs within the treated area(s).
3. After the treatment is complete, the Gregory specialists will disassemble and remove the equipment and do a final inspection to make sure all bed bugs are gone.

Schedule Your Free Inspection and Estimate Today

Addressing a suspected bed bug infestation as quickly as possible is a prudent move: the mature female bed bug lays 5 to 12 eggs a day — and a bed bug's average lifespan ranges from 120 days to more than 365 days. Bed bugs do not go away on their own.

If you're unsure as to whether you have bed bugs, we'll be glad to send a service technician to inspect your property. We also offer free on-site estimates. To find out how simple and affordable our Thermal Remediation Treatment is, just call us at 1-800-675-6226, or visit us on the web at GregoryGoGreen.com.

Gregory Pest Solutions will take "the bite" out of your property's bed bug problem with our advanced Thermal Remediation Treatment Process. It's safe, clean, and economical — and it's the GUARANTEED-EFFECTIVE SOLUTION to any bed bug infestation.
